

Kester Clear™

It's not clear until it's Kester Clear™. One of the most prevalent dangers in the environmental health industry is a phenomenon called "false negative". "False negative" refers to a negative lab test or inspection drawn from a house with a mold or other VOC infection. In the business of building inspections, many homes are declared to be free of mold when they are actually unsafe and toxic.

Mold can be a very illusive and difficult thing to find. Many industry standard mold tests and inspection techniques render a high probability for a "false negative". There are many new techniques and procedures that can be performed to ensure that any and all potential problem areas are found.

Jason Kester has trained with the most innovative and renowned mold specialist, inspectors and building biologist. He is dedicated and driven to use the most thorough tools, procedures and techniques to ensure that a "Kester Clear™" home is truly clear of mold and safe for even the most sensitive inhabitant.
